AMAZON

Workforce & Sales Intelligence Dashboard

OBJECTIVE

Step into the role of a Business Analyst at a retail tech company. Your job is to transform raw Amazon sales data into a dynamic Excel dashboard. You'll clean the data, apply smart lookups, summarize using Pivot Tables, and present findings with filters and KPIs to support business decisions.

The sales department at **Amazon Retail Partners** has provided a raw dump of 100 sales transactions across multiple regions, products, and customer profiles. Management wants a report that not only shows how products and regions are performing but also helps them explore customer trends and fulfillment efficiency. You're expected to build a dashboard that combines smart lookup logic with Pivot based summaries.

ROLE

As a reporting analyst, your deliverables include:

- Cleaning the data for consistency and completeness
- Structuring fields like dates, regions, and categories
- Using XLOOKUP to connect relevant details for enhanced reporting
- Creating Pivot Tables for insights into revenue, fulfillment, and cancellations
- Designing a visual dashboard to make insights easy to access.

TOOLS USED

Pivot Table (Row, Column, Values, Filter)

- Basic functions: SUM, COUNT, AVERAGE, IF, TEXT, IFERROR
- XLOOKUP for matching across sheets or within structured data
- Date grouping, filtering, custom columns
- Conditional formatting, slicers, and charts for visual appeal

1. DATA CLEANING & PRE-PROCESSING

- Ensure date columns (Order Date, Delivery Date, Cancel Date) are in date format
- Remove extra spaces and blanks
- Standardize Region, Payment Method, and Delivery Status entries Identify and tag cancelled orders using Cancel Date and Delivery Status

2. CREATING PIVOT TABLES

- Show Total Sales Amount by Region and Product Category→pivot table
- Count of Orders by Delivery Status--→pivot table
- Average Delivery Time = Delivery Date – Order Date
- Add filter for Payment Method and Product Category

3. APPLYING XLOOKUP FOR CROSS-REFERENCING

- Use XLOOKUP to match Customer ID to Customer Name from a separate Customer Master Sheet (you can simulate it)
- Create a new column: Delivery Performance

=IF([Delivery Date]-[Order Date] <= 2, "Fast", "Slow")

Use IFERROR to avoid errors where delivery date is missing (e.g., cancellations)

4. Advanced Reporting: KPI Metrics & Calculated Fields

- Create a field: Cancellation Rate by Region (Cancelled Orders / Total Orders)
- Add Calculated Field in Pivot: Effective Sales = Sales Amount for Delivered Orders only
- Create KPI Cards for:
  - Total Revenue
  - % of Fast Deliveries
  - Top 3 Performing Regions

Highest-selling Product

5. FINAL DASHBOARD DESIGN

- Use Pivot Charts and Slicers to allow filtering by Region, Payment Method, and Delivery Status
- Highlight high-performing regions or products using Conditional Formatting
- Add a drop-down to filter sales by Month (group Order Date in Pivot)
- Layout recommendations:
    - Left Panel: Filters (Slicers)
    - Center: Pivot Charts

Right Panel: KPIs and Summary Cards
